

## Wireless solutions

Full support of TelMex Inifinitum 2Wire&trade; DSL device installations, including both wireless and wired DSL modems. Tweak your DSL modem for optimum speed, increase the broadcast range of your wireless signal, secure your network and data, and much more.

Wireless networks can save you alot of money in environments where existing CAT5 wiring doesn't exist already. Hiring professionals to come in and run cable through all your walls, install jacks and recepticles in each room, and install a patch panel can easily cost you several thousand dollars. Eliminate this need by using a wireless solution for a fraction of the cost, while empowering you with the freedom and functionality of being online anywhere & everywhere.

Need a stronger wireless signal to reach your patio, garage, pool area, guest house, office, sundeck, or garden? Wireless repeaters and extenders can strengthen your broadcast signal for full coverage throughout your home or office. I have setup many successful implementations here in Los Cabos, due to the popularity of this issue and the prevalence of concrete construction.

Need longer range extensions ? Using directional wifi signal hardware, we can bounce your wireless signal up to 2 kilometers (must be in line of sight). Without phone lines or another wired high speed alternative, this is often a much more viable and cost-effective solution than the only other option, satellite internet connectivity, which can be very expensive, and often requires use of a phone line for upload connectivity. Useful in remote, or new developments where phone lines or high speed internet is not yet available - perfect for the fast developing Los Cabos area !
